

What is the use of a Firewall on a computer?

A. Gaming purposes

B. For Installation

C. For security

D. None of these

Explanation:

A firewall is used on a Computer for Security purposes.

Firewall

In computing, a firewall is a network security system that monitors and controls the incoming and outgoing network traffic based on predetermined security rules. A firewall typically establishes a barrier between a trusted internal network and untrusted external network, such as the Internet. [Wikipedia](#)

What is the use of a Firewall on a computer?

Ans: There are many uses of a firewall on an operating system. However, its main purpose is to protect the computer from in and outgoing traffic malicious activities.
